ADVANCED LEAK TESTING MACHINES

## SMART, FAST, PRECISE LEAK TESTS FOR HVAC INDUSTRY

Leak tests are critical in the quality control of parts manufactured in the HVAC industry. Produced parts should work for many years in the systems in leak-proof systems in which they are installed. It is critical for the brand value of the company that the products used in the installation have to be changed because they leak afterward. For this reason, leak tests should be performed to add value to the products produced and contribute to positive brand perception. Leaks Testing is an NDT that can be applied to all products that come out of your production line, leaving no room for mistakes. Presenting the products to the customers/market with test result reports is the most crucial step that will increase the added value of the product. You can test your products with ADLEMA BT 4000 Series test devices without using water, present them to your customers with test result reports and perform leak tests in line with your production needs.

### HEATING & COOLING SYSTEMS

Boilers, combi boilers, liquid cooling systems, cooling components

### AIR CONDITIONING SYSTEMS

Air conditioners, air ducts, heat pumps

### INSTALLATION SYSTEMS AND ELEMENTS

Installation elements, LPG-LNG systems, pipes, valves, valves, apartment entrance units, water meters, fire installation elements, measuring devices

### PLUMBING PRODUCTS

Bathroom, sink accessories, faucets, fittings
